EpiData  EpiData is a program for DataEntry.
EpiData works on Machintosh Computers with RealPc Emulator and PC’s with Windows 95/98/NT/2000/ME/XP.
Linux variants which can run Wine

For more information: www.epidata.dk

The work process is as this (optional parts are dotted):

Define datastructure and layout of DataEntry

Define checks and jumps
- attach labels to variables
- range checks
- define conditional jumps (filters)
- consistency checks across variables

Attach labels to values
- Reuse from collection
- Define new

Define values as missing value

Change structure or layout when necessary refine structure

Preview DataForm and simulate dataentry

Create datafile

Enter all the data.

Enter data twice and compare directly at entry or enter separately and compare afterwards.

Correct errors based on original paper forms

Revise structure without loosing data

Generate documentation:
List of data, codebook and variable overview including defined checks and labels

Dataset is ready.
- archive copy with documentation.
- export data for special analysis
- analyse with EpiData Analysis
